What *is* a proton, neutron, nucleus?

What *is* a proton, neutron, nucleus?

What *is* a proton, neutron, nucleus?

At high energy: an unseparated, broadband beam of quarks, anti-quarks, and gauge bosons (primarily gluons), and perhaps other constituents, yet unknown.

*40 years of an amazingly robust idealization:
Renormalization group-improved Parton Model*

*Factorization theorem(s) + one-dimensional parton distributions,
no correlations among the partons*

What *is* a proton, neutron, nucleus?

At high energy: an unseparated, broadband beam of quarks, anti-quarks, and gauge bosons (primarily gluons), and perhaps other constituents, yet unknown.

*40 years of an amazingly robust idealization:
Renormalization group-improved Parton Model*

*Factorization theorem(s) + one-dimensional parton distributions,
no correlations among the partons*

Why and what about an Electron Ion Collider?

HERA - Electron Proton Collider

H1

460-920 GeV protons

HERA

ZEUS

27.5 GeV electrons

PETRA

HERA-I 1992-2000
HERA-II 2003-2007

HERA - Electron Proton Collider

Observed (or known):

$$e = (0, 0, -E_e, E_e)$$

$$e' = (E'_e \sin \theta'_e, 0, E'_e \cos \theta'_e, E_e)$$

$$p = (0, 0, E_p, E_p)$$

i.e. angles are defined *w.r.t. the hadron beam direction* (HERA-convention).

Relevant invariants:

$$s = (e + p)^2$$

Square of total c.m. energy

$$q = e - e' \quad Q^2 = -(e - e')^2$$

Square of (4-)momentum transfer

$$x = \frac{Q^2}{ys}$$

Bjorken-x, ~parton mom. fraction

$$y = (q.p)/(e.p)$$

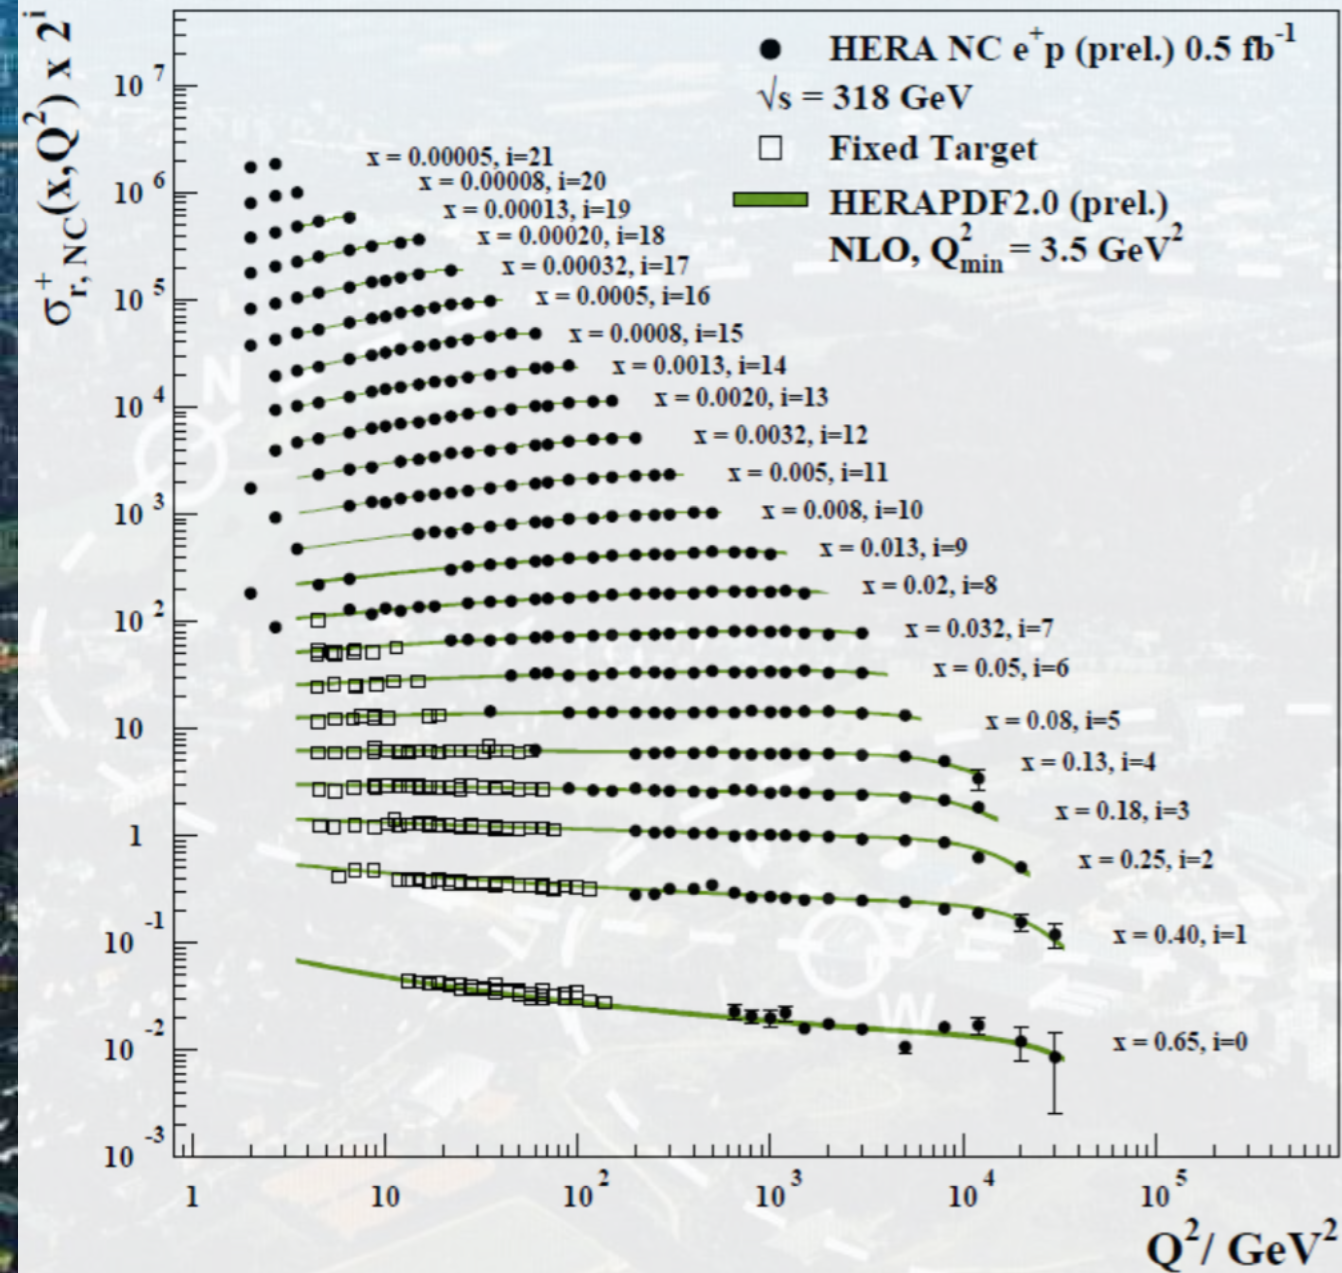

Fractional energy transfer

x, Q^2 can be reconstructed from the scattered electron, the “current jet”, or hybrids.

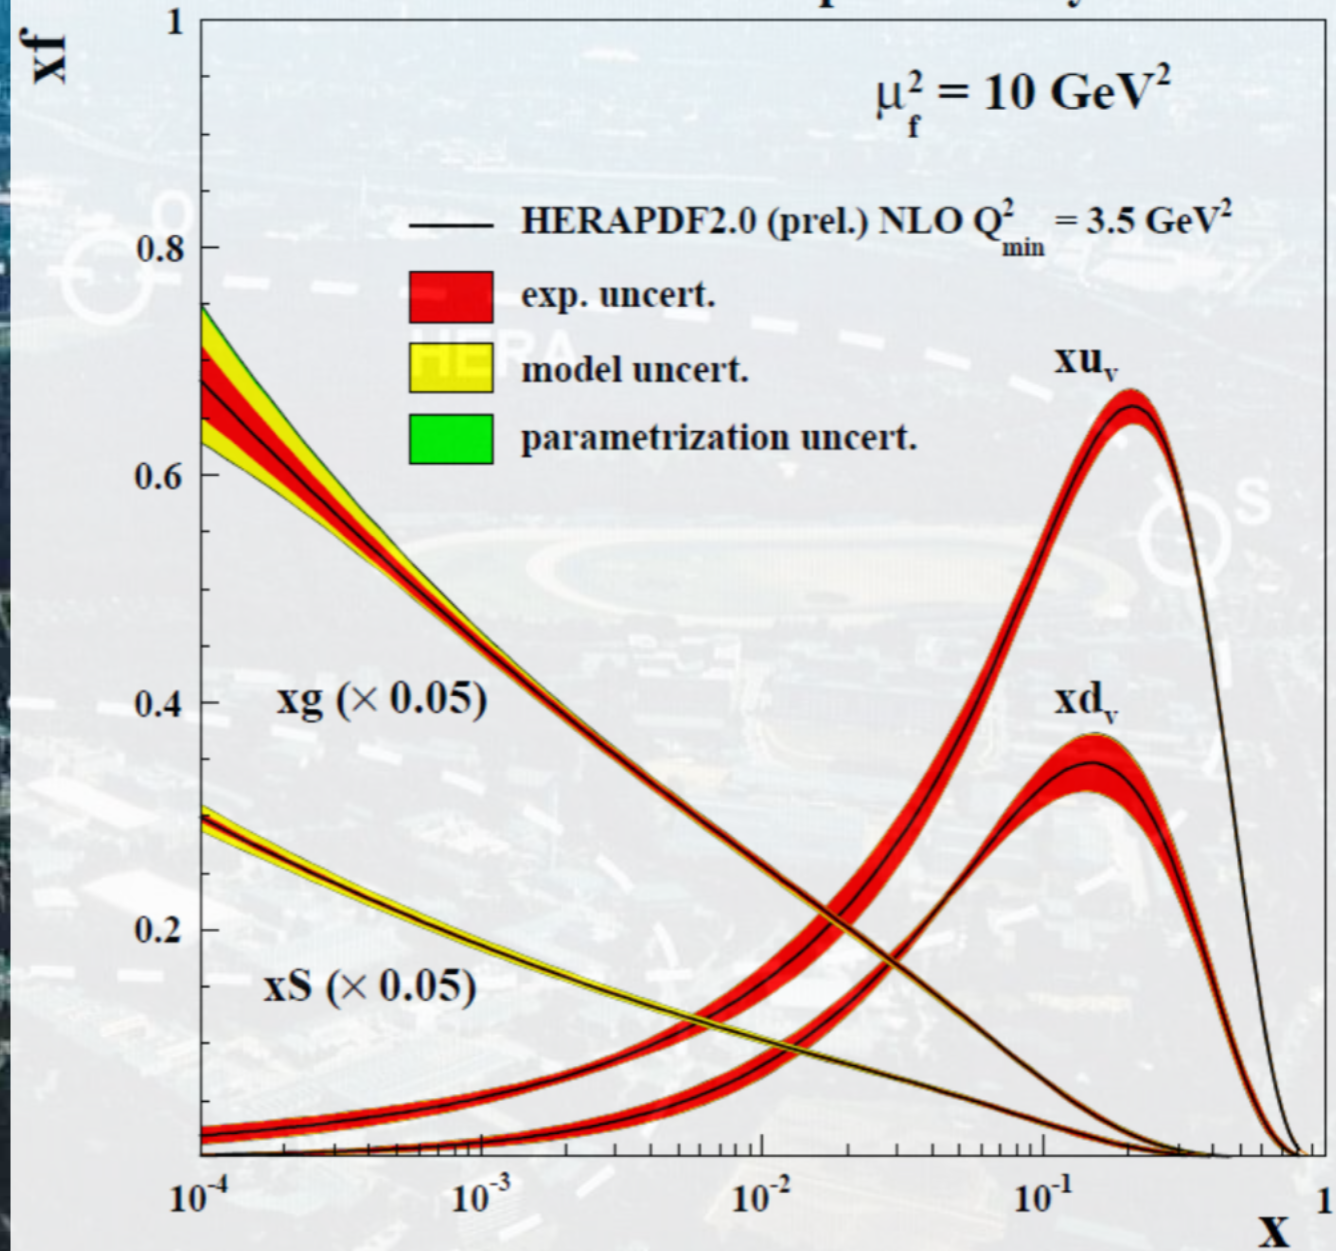

HERA-I 1992-2000
HERA-II 2003-2007

HERA's Legacy

H1 and ZEUS preliminary

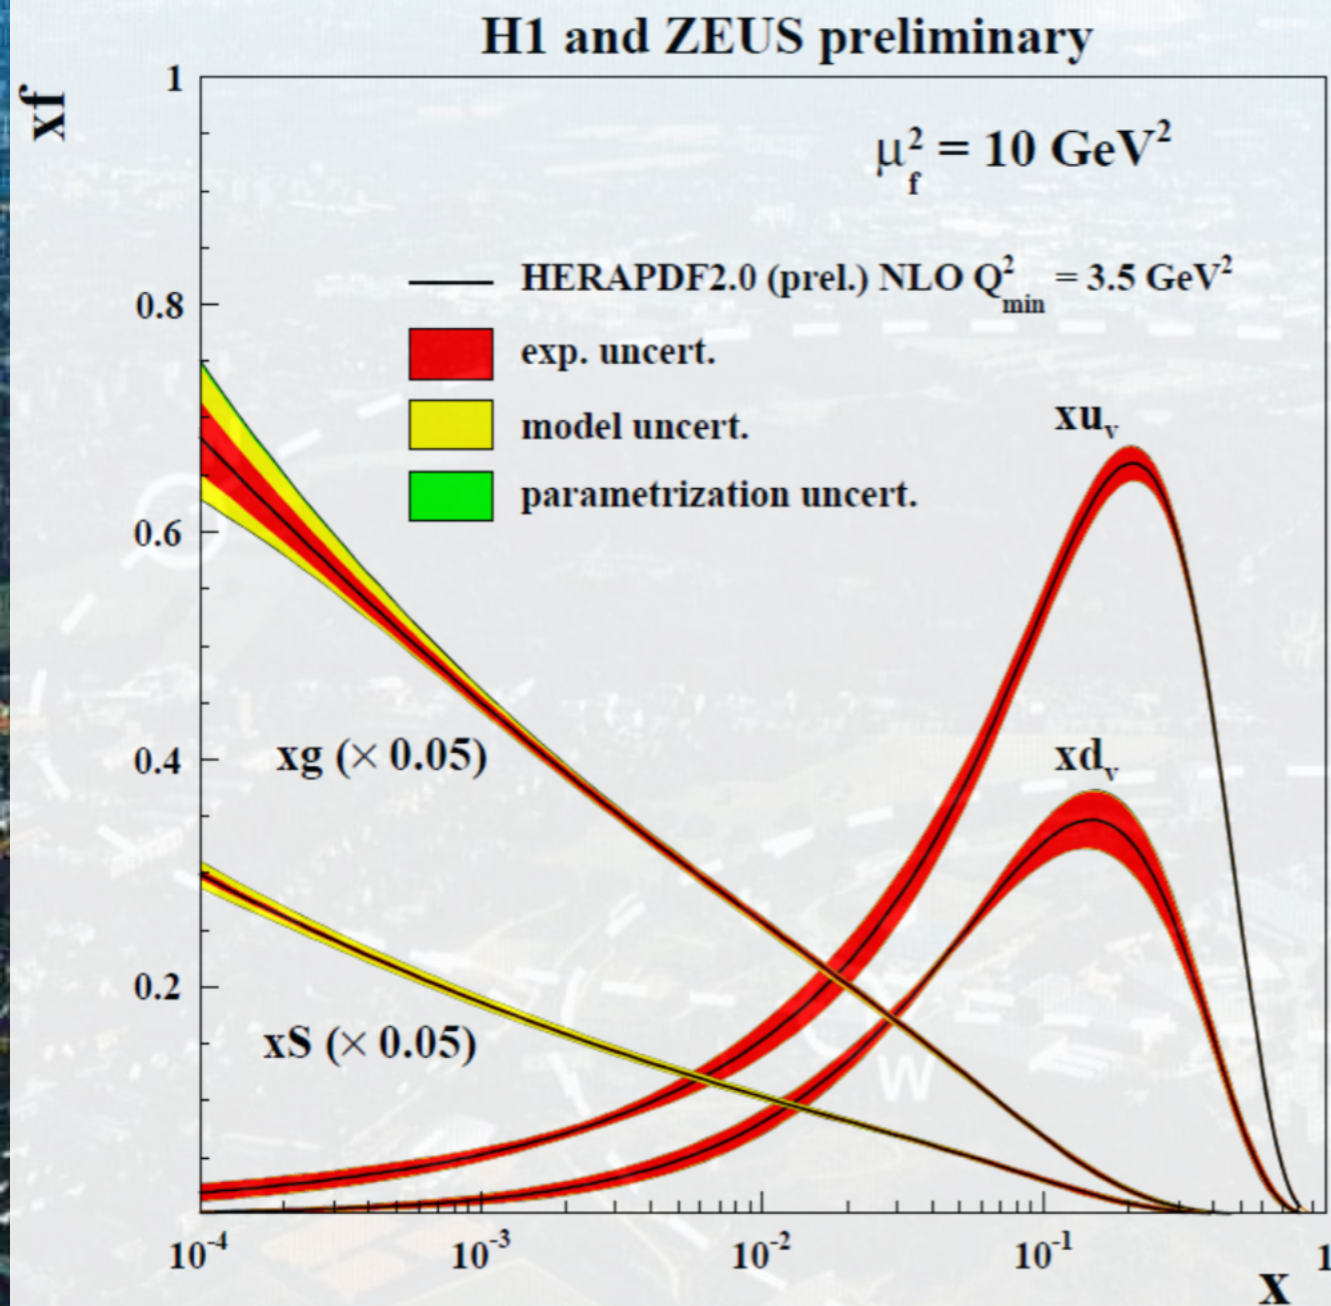

H1 and ZEUS preliminary

Vast body of *precision* measurements over a wide kinematic range,
 Best possible insight in high-energy proton structure to date.

HERA's Legacy

Proton structure at high-energy is:

- *far* from elementary,
- gluon-dominated for $x < 0.1$,

Gluon content increases with decreasing x ,

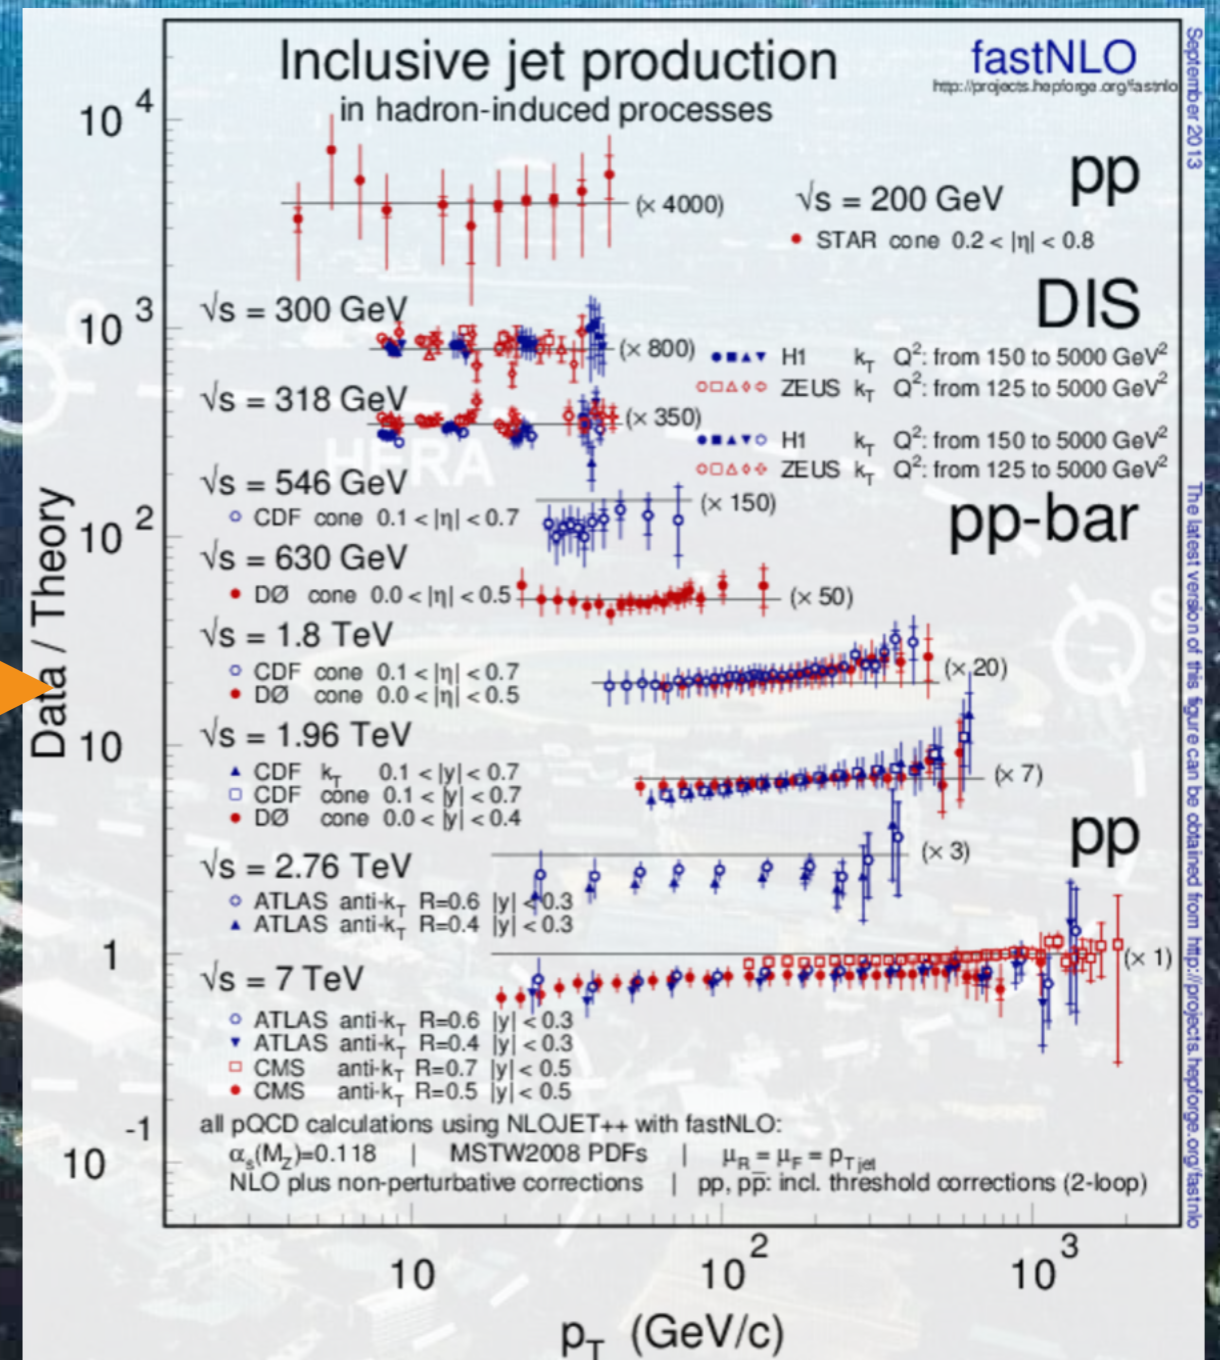

Gluons pose a number of questions

HERAPDF2.0:

- 15 parameters,
- ~ 1400 combined data points,

PETRA

HERA's Legacy

Factorization, the separation of short distance and long distance physics, combined with PDFs are 'universally invaluable' in hard scattering processes.

What *is* a proton, neutron, nucleus?

At high energy: an unseparated, broadband beam of quarks, anti-quarks, and gauge bosons (primarily gluons), and perhaps other constituents, yet unknown.

*40 years of an amazingly robust idealization:
Renormalization group-improved Parton Model*

*Factorization theorem(s) + one-dimensional parton distributions,
no correlations among the partons*

Really?

Really? - Nuclear Modification

CMS, ArXiv:1401.4433
H. Paukkunen, ArXiv:1401.2345

Textbook nuclear EMC effect, shadowing, and anti-shadowing remain in search of a comprehensive explanation.

Experimental opportunities:

Near-term:

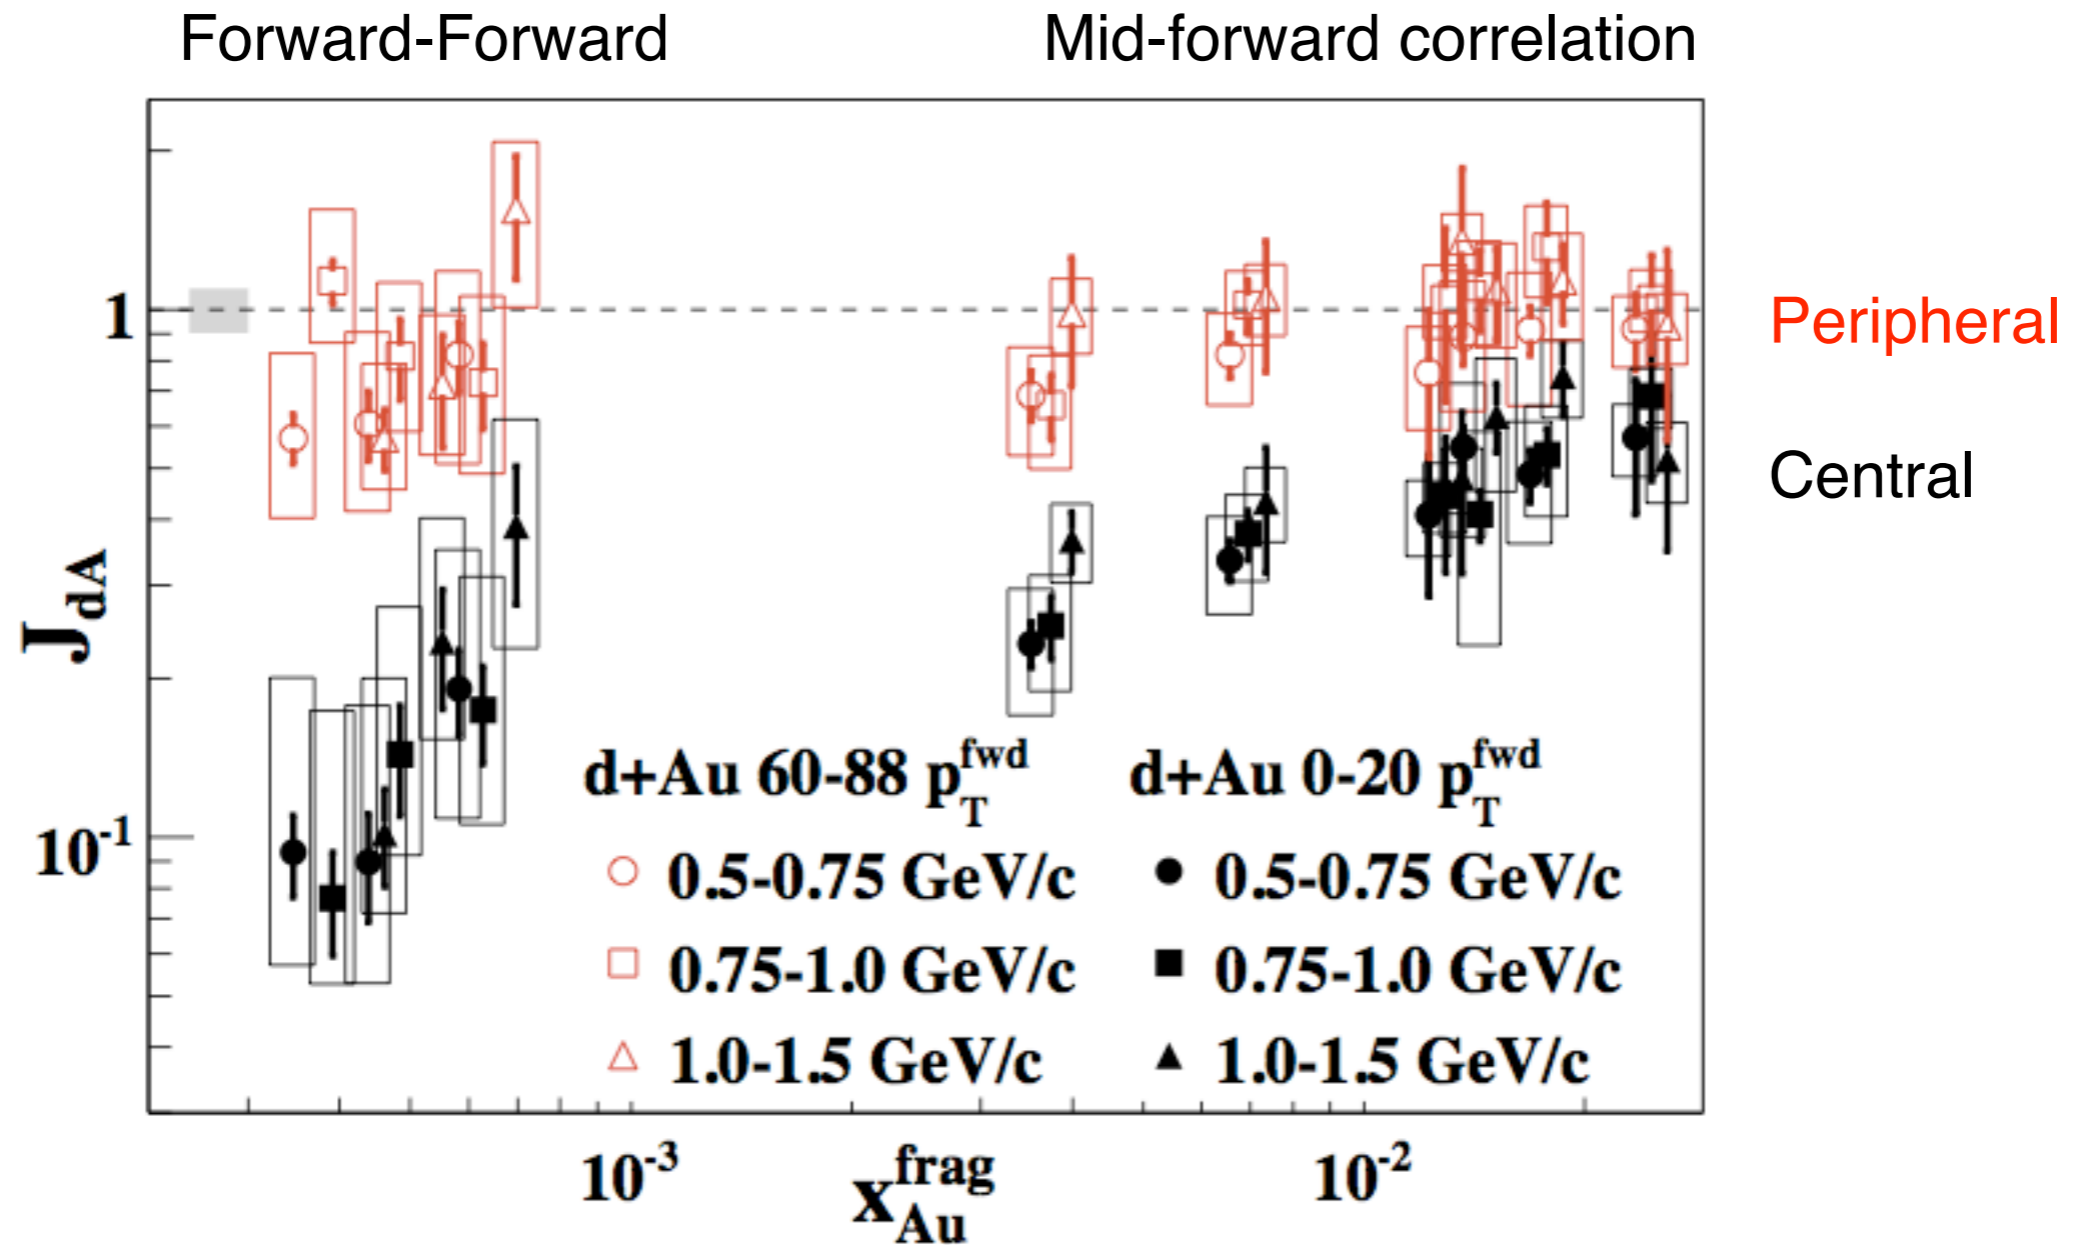

- (polarized) p+A scattering,
- continued DIS, DY,
- ...

EIC-term:

- QCD-evolution, esp. gluon region,
- NC, CC probes,
- 1-particle semi-inclusive data,
- n-particle correlations,
- diffraction,
- exclusive reactions (imaging),
- ...

Simply this student's list - input sought.

Really? - Forward Particle Suppression

Really? - Ridges, ridges, ridges

CMS 2010, $\sqrt{s}=7\text{TeV}$
MinBias, $1.0\text{GeV}/c < p_T < 3.0\text{GeV}/c$

$N > 110$, $1.0\text{GeV}/c < p_T < 3.0\text{GeV}/c$

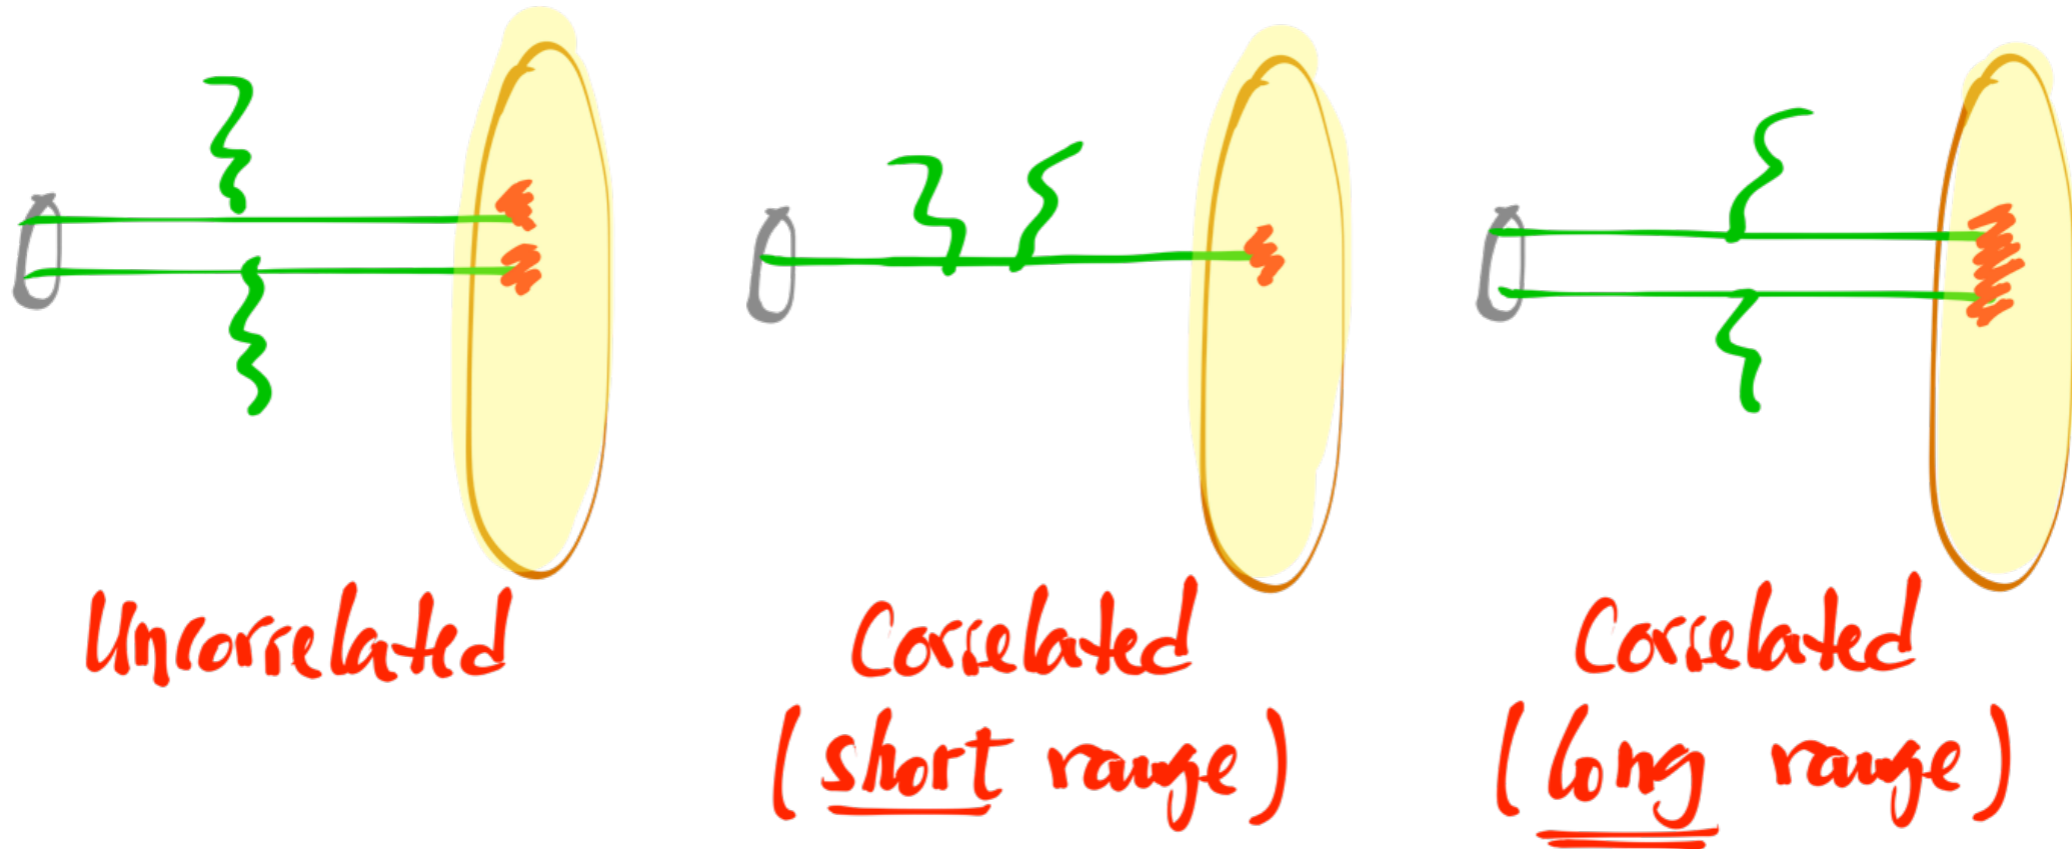

Seen in p+p, p+A at the LHC, A+A at RHIC and the LHC...

Causality implies that this structure is formed very early,

Initial state, final state, both?

Really? - Ridges, ridges, ridges

COLOR Correlations in transverse plane $\sim Q_{sat}^{-1}$

Salgado, QM'14

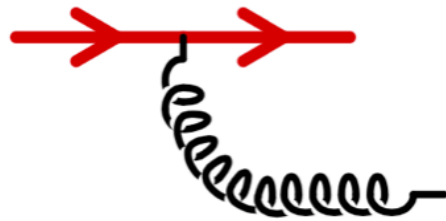

Seen in p+p, p+A at the LHC, A+A at RHIC and the LHC...

Causality implies that this structure is formed very early,

Initial state, final state, both?

QCD radiation and saturation

QCD **splitting**:

$$dP \propto \alpha_s \frac{d^2 k_{\perp}}{k_{\perp}^2} \frac{dx}{x}$$

is calculable; it is soft and collinear divergent - these divergencies must be resummed,

Density of gluons per unit of transverse area:

$$\rho \propto x g(x, Q^2) / \pi R^2$$

Cross section for gluon **recombination**:

$$\sigma \propto \alpha_s / Q^2$$

Saturation:

$$1 < \rho\sigma \rightarrow Q^2 < Q_s^2(x) \sim \left(\frac{A}{x}\right)^{1/3}$$

Gribov, Levin, Ryskin 1983

Dense system, non-linear evolution - onset is largely an experimental question, effective theory/theories.

Saturation at HERA? - Think outside the PDF!

- No/limited evidence from DGLAP fits in sub-ranges,

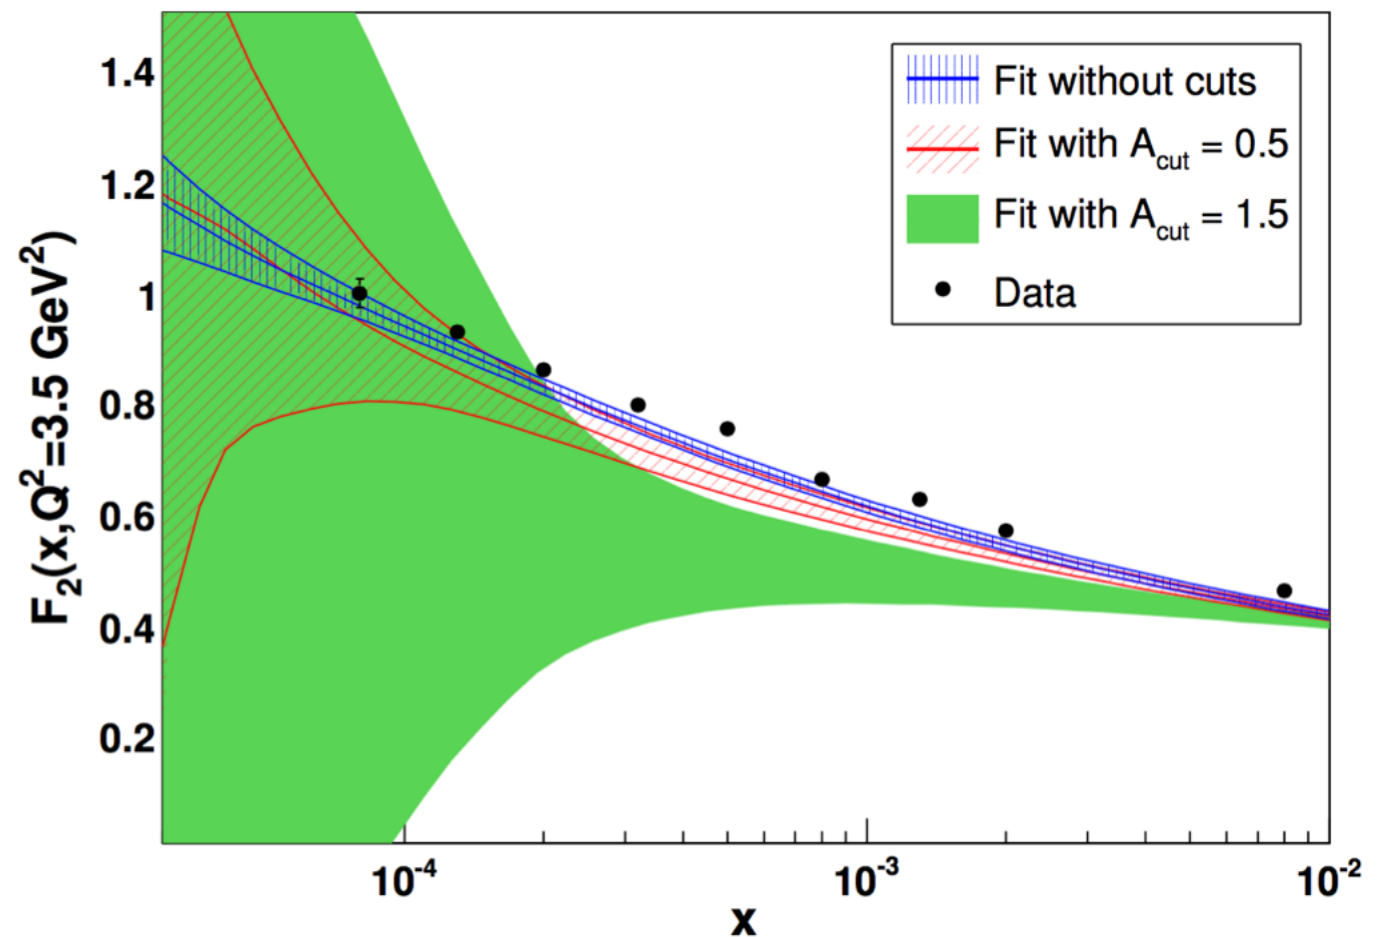

Tendency to undershoot the data, however, do note the uncertainties.

Authors have studied NNLO and reject this as a possible cause.

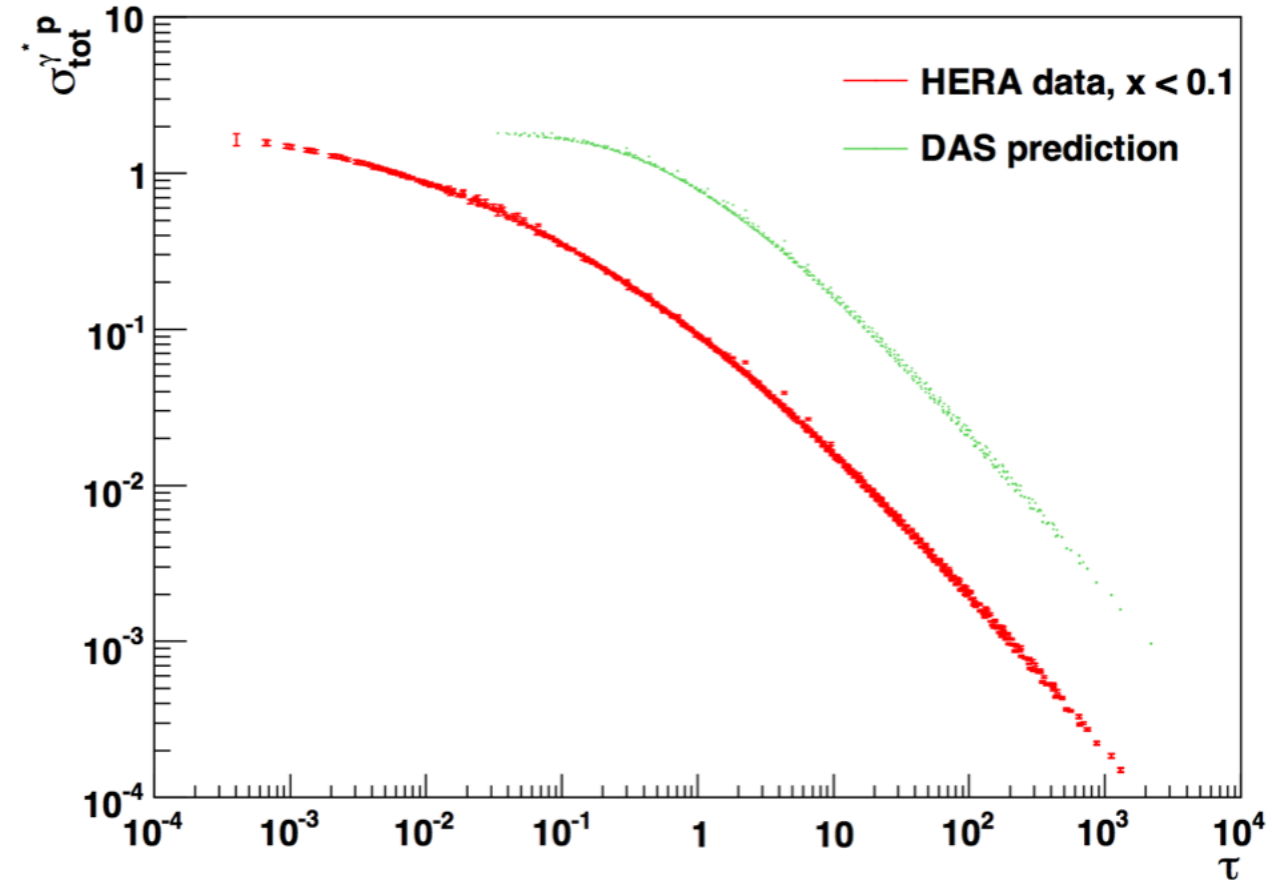

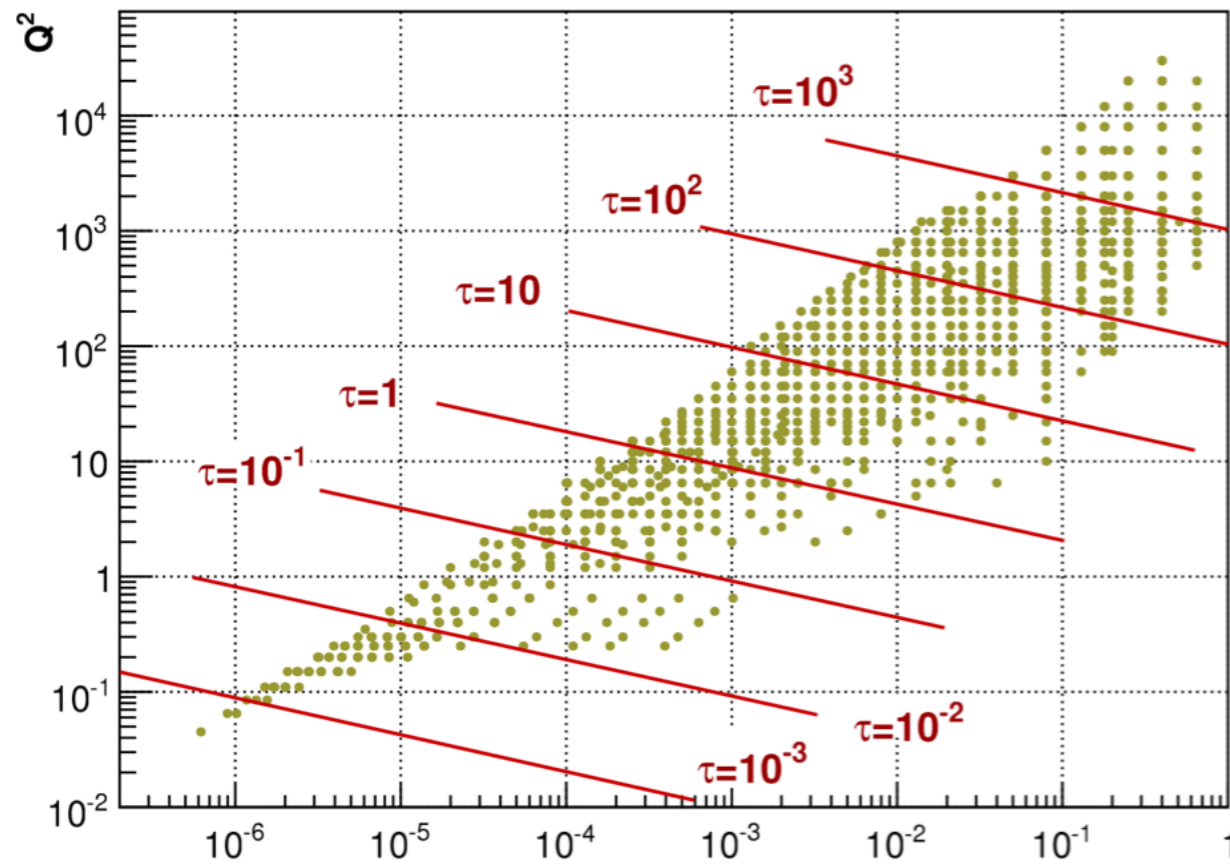

Idea (Gellis, Caolo et al):

- cut out data in a presumed saturation region,
- determine PDFs from remaining data,
- evolve down and compare with all data

- Likewise, no evidence from comparisons with F_L or F_2 -charm

Saturation at HERA? - Think outside the PDF!

- HERA c.s. data exhibit geometrical scaling with respect to

$$\tau = \frac{Q^2}{Q_s^2(x)} = \frac{Q^2}{Q_0^2} \frac{x^\lambda}{x_0} \quad \text{for } x < 0.01$$

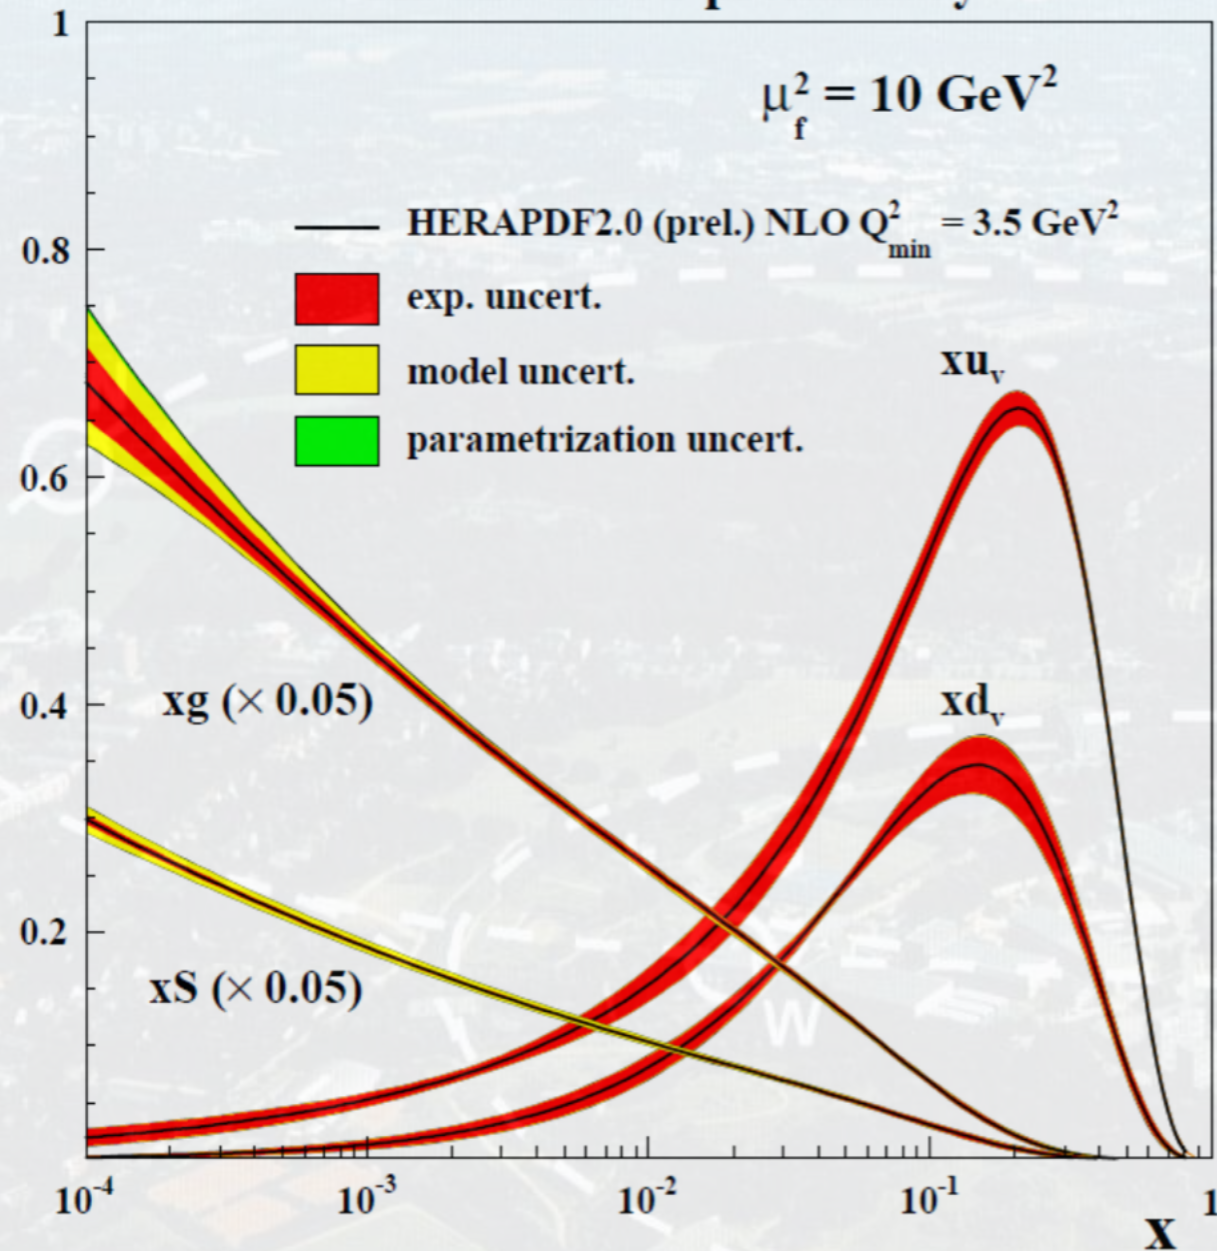

not seen in prior fixed-target experiments - Stasto et al.

However, DLL LO solution to DGLAP *also* scales - Caolo et al.

- ~15% of events is diffractive (!).

HERA's Legacy

H1 and ZEUS preliminary

Exquisite insight in proton structure in terms of quark and gluon degrees of freedom,

... and also some quite remarkable voids;

Precision F_L - insufficient time,

Test isospin, u-d, - no deuterons,

d/u at large x - luminosity,

Strange quark distributions - luminosity,

Spin puzzle - no hadron beam polarization,

Quark-gluon dynamics in nuclei - no nuclei,

Saturation - insufficient \sqrt{s} / no nuclei,

...

U.S.-based EIC - Two Facility Concepts

eRHIC:

- upgrade to RHIC hadron beam,

MEIC:

- upgrade to CEBAF 12 GeV electron beam,

U.S.-based EIC - Two Facility Concepts

eRHIC:

- upgrade to RHIC hadron beam,
- add ERL and FFAG Recirculating electron ring,
- 6.3 - 15.9 and 21.2 GeV e energy,
- Heavy Ions up to 100 GeV/u
- \sqrt{s} up to 93 GeV
- $L \sim 10^{33} \text{ cm}^{-2}\text{s}^{-1}/A$ base design.

MEIC:

- upgrade to CEBAF 12 GeV electron beam facility,
- new hadron injector,
- new figure-8 collider configuration,
- 3-12 GeV electron energy,
- 12-40 GeV/u Heavy Ion energy,
- $L \sim 10^{34} \text{ cm}^{-2}\text{s}^{-1}/A$

U.S.-based EIC - Science Focus

coherent contributions from many nucleons effectively amplify the gluon density being probed.

The EIC was designated in the 2007 Nuclear Physics Long Range Plan as "embodying the vision for reaching the next QCD frontier" [1]. It would extend the QCD sci-

ence programs in the U.S. established at both the CEBAF accelerator at JLab and RHIC at BNL in dramatic and fundamentally important ways.

The most intellectually pressing questions that an EIC will address that relate to our detailed and fundamental understanding of QCD in this *frontier* environment are:

- **How are the sea quarks and gluons, and their spins, distributed in space and momentum inside the nucleon?** How are these quark and gluon distributions correlated with overall nucleon properties, such as spin direction? What is the role of the orbital motion of sea quarks and gluons in building the nucleon spin?
- **Where does the saturation of gluon densities set in?** Is there a simple boundary that separates this region from that of more dilute quark-gluon matter? If so, how do the distributions of quarks and gluons change as one crosses the boundary? Does this saturation produce matter of universal properties in the nucleon and all nuclei viewed at nearly the speed of light?
- **How does the nuclear environment affect the distribution of quarks and gluons and their interactions in nuclei?** How does the transverse spatial distribution of gluons compare to that in the nucleon? How does nuclear matter respond to a fast moving color charge passing through it? Is this response different for light and heavy quarks?

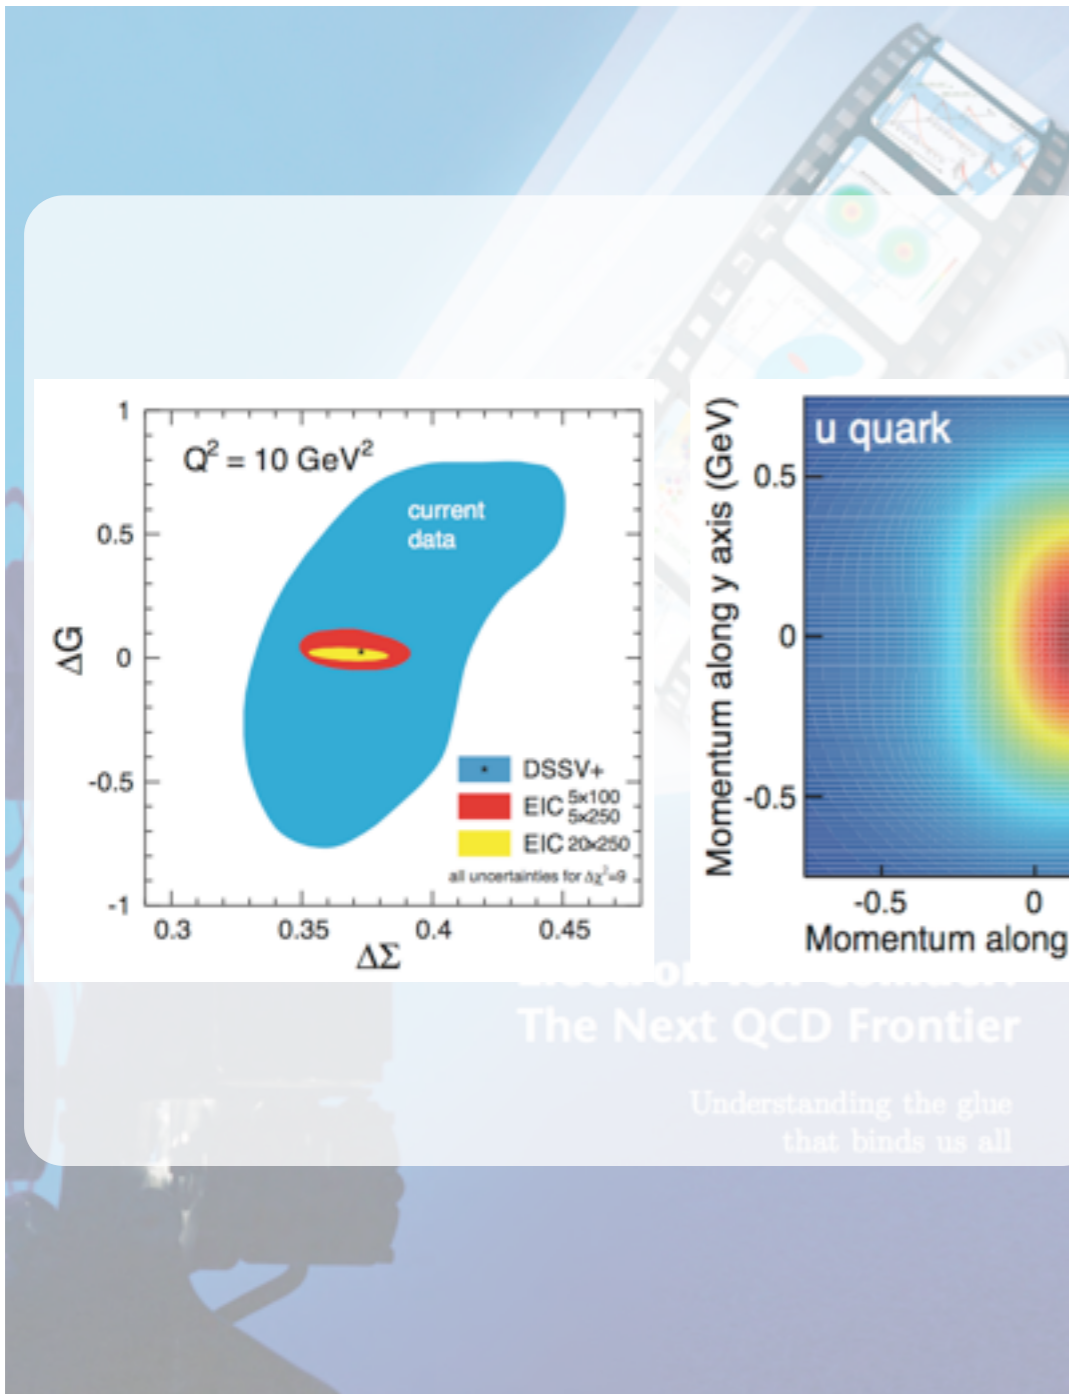

Answers to these questions are essential for understanding the nature of visible matter. An EIC is the ultimate machine to provide answers to these questions for the following reasons:

- A collider is needed to provide kinematic reach well into the gluon-dominated regime;
- Electron beams are needed to bring to bear the unmatched precision of the electromagnetic interaction as a probe;
- Polarized nucleon beams are needed to determine the correlations of sea quark and gluon distributions with the nucleon spin;
- Heavy ion beams are needed to provide precocious access to the regime of saturated gluon densities and offer a precise dial in the study of propagation-length for color charges in nuclear matter.

The EIC would be distinguished from all past, current, and contemplated facilities around the world by being at the intensity frontier with a versatile range of kinematics and beam polarizations, as well as beam species, allowing the above questions to be tackled at one facility. In particular, the EIC design exceeds the capabilities of HERA, the only electron-proton collider

to date, by adding a) polarized proton and light-ion beams; b) a wide variety of heavy-ion beams; c) two to three orders of magnitude increase in luminosity to facilitate tomographic imaging; and d) wide energy variability to enhance the sensitivity to gluon distributions. Achieving these challenging technical improvements in a single facility will extend U.S. leadership in accelerator sci-
